

4. SIR GEORGE PRINT

196

The Sir George tracks consist of 7 11.5" prints. Shown here is the first of these tracks with the corresponding cast made within an hour of the excavation. Note the deeper depression along the outside of the print.

Length: 11.5 inches
Flange width: 4.25 in.
Heel width: 3.25 in.

The display cast faithfully preserves details of the original footprint. Note the bulge at the base of the 5th. metatarsal. Note that the great toe is extended longer than the other toes and that the second toe is extended longer than the other toes and that the second toe is curved downward. The receding mud has filled the front portion of the depression left by the other curled toes in the forward locomotion. This is all uniquely consistent with footprints of man on yielding surfaces.
