

Dr. Clifford Wilson and Cliff Nickmier point to a dinosaur footprint and a human footprint only seven and a half inches from each other. This was at Locus B at the McFall site, in June 1982. These prints were recovered, with the press watching, from under that 12 inches of limestone. Dr. Wilson is sitting on the continuation of the ledge.

A healthy education instructor placed his foot within the newly-excavated footprint. The contour fit was comfortable.
